

Are you about to waste money by buying a computer for POS? Probably.

Smart POS devices are replacing PC's.

You don't need to buy a computer for Point of Sale. Traditional PC's are being forced out by smart devices. The PC and the purpose is becoming one device.

Embedded processors are more reliable for POS.

Traditional POS PC's fail due to heat, dirt, and power supply breakdown. The life cycle of PC's is typically 12 months. This PC model does not work for POS in chain stores. When an embedded processor only needs 5 volts and 15 watts to run Windows or Linux applications, you minimize heat, eliminate the noise and failure of fans, and use a low cost off the shelf power supply.

Try pcKeyboard® for Free.

By embedding the Intel® Atom™ processor into the Cherry SPOS keyboard the need for a PC is eliminated. The low heat, long life cycle processor and the proven Cherry keyboard provides a streamlined customer transaction workspace.
